$x(t)$: the displacement of a Brownian particle of mass m is governed by Newton's second law

$$m\ddot{x} = -\frac{\dot{x}}{\mu} - \frac{\partial V}{\partial x} + f_{\text{Random}} \quad (1)$$

- $-\frac{\dot{x}}{\mu}$: Friction force due to viscosity of the fluid.

$$\mu = (6\pi\eta R)^{-1} : \text{mobility}, \quad \gamma = \frac{1}{m\mu} : \text{frictional factor}$$

- $-\frac{\partial V}{\partial x}$: external potential V e.g. gravity
- f_{Random} : Random force of zero mean due to the impacts of fluid particles.

Hypothesis: $\gamma \gg 1$ (Overdamped)

The viscous term dominates the inertial one, so, ignore the acceleration.

Then, Eq. (1)

$$m\ddot{x} = -\frac{\dot{x}}{\mu} - \frac{\partial V}{\partial x} + f_{\text{Random}}$$

reduces to Langevin Equation

$$\begin{aligned}\dot{x} &= -\mu \frac{\partial V}{\partial x} + \mu f_{\text{Random}} \\ &= -\mu \frac{\partial V}{\partial x} + \eta(t)\end{aligned}\quad (2)$$

Assume that η : zero mean and

$$\langle \eta(t), \eta(t') \rangle = D\delta(t - t') \quad (3)$$

D is related to “Diffusion of the Brownian particle”

If $V(x) = x^2$, (Particle connected to a Hookian spring), then, Eq. (2) is O-U equation

$$\dot{x} = -\mu x + \eta(t). \quad (4)$$

- Deterministic velocity: $v(x) = -\mu x$
- Stochastic velocity $\eta(t)$
- Mean position: $\langle x(t) \rangle \equiv E(x(t)) = x(0)e^{-\mu t} \rightarrow 0$ as $t \rightarrow \infty$
- Fluctuation around the mean position

$$\langle (x(t) - \langle x(t) \rangle)^2 \rangle \equiv Var(x(t)) \rightarrow \frac{D}{2\mu}, \text{ as } t \rightarrow \infty \quad (5)$$

In physics (canonical ensemble), once the Brownian particle reaches the equilibrium (stationary process) with the fluid at a temperature T , the probability of finding a Brownian particle at position x is given

$$\mathcal{P}_{\text{equilibrium}}(x) = \frac{1}{\sqrt{2\pi k_B T}} \exp\left[-\frac{x^2}{2k_B T}\right]$$

k_B is Boltzmann constant.

Then, $\langle x^2 \rangle_{\text{equilibrium}} = k_B T$, by (5) $\langle x^2 \rangle_{\text{equilibrium}} = \frac{D}{2\mu}$

Another derivation by Green (1952) and Kubo (1966)

at the equilibrium state

- The mean velocity of $x(t)$ at $(t, x(t))$ is

$$v(x(t)) \equiv -\mu x(t)$$

- The autocorrelation function of $v(x(t))$ is

$$R(t) \equiv E(v(x(0))v(x(t))) = \langle v(x(0))v(x(t)) \rangle = \frac{\mu D^2}{2} e^{-\mu t} \quad (7)$$

$\Phi(\omega)$ is Fourier transform of $R(t)$, it is the Power spectrum of $v(x(t))$. $\Phi(\omega)$ can be regarded as “energy” in the frequency ω .

退出

- moreover, by direct computation

$$R(t) = \langle v(x(0))^2 \rangle D e^{-\mu t} \quad (8)$$

- So,

$$\frac{D^2}{2} = \int_0^\infty R(t) dt = \langle v(x(0))^2 \rangle D \mu \quad (9)$$

- In fact, $\langle v(x(0))^2 \rangle$ is kinetic energy, then $\langle v(x(0))^2 \rangle = k_B T$
- Therefore, obtain Einstein relation $D = 2\mu k_B T$ again.

Solution:

We get information of Markov process X_t by observable

$$\varphi(X_t) = (\varphi_1, \varphi_2, \dots, \varphi_m)(X_t)$$

Therefore, consider the “Mean Velocity” and “Diffusion Coefficient” of observable $\varphi(X_t)$.

Then, go back to Nelson 1966

Theorem: Green-Kubo formula: For the stationary Markov process $\{X_t\}_{t \geq 0}$, let

$$\mathcal{J} = \left\{ f \in L^2(\Xi, \mu) : \lim_{t \rightarrow \infty} \|P_t f - \langle f \rangle_\mu\|_{L^2(\mu)} = 0 \right\}. \quad (13)$$

Then for any $\varphi_i, \varphi_j \in \mathcal{D}(\mathcal{A}) \cap \mathcal{J}$, and $\phi_i \phi_j \in \mathcal{D}(\mathcal{A})$

$$\langle G_{ij} \varphi(X_t) \rangle = \int_0^\infty \langle V \varphi_i(X_0) V \varphi_j(X_t) \rangle dt + \int_0^\infty \langle V \varphi_j(X_0) V \varphi_i(X_t) \rangle dt. \quad (14)$$

or,

$$\left(\langle G \varphi(X_t) \rangle \right)_{i,j=1 \dots m} = \int_0^\infty \langle V \varphi(X_0) \otimes V \varphi(X_t) \rangle dt + \int_0^\infty \langle V \varphi(X_0) \otimes V \varphi(X_t) \rangle dt. \quad (15)$$

Remark:

- If X_t is reservable, Green-Kubo formula is

$$\langle G_{ij}\varphi(X_t) \rangle = 2 \int_0^\infty \langle V\varphi_i(X_0)V\varphi_j(X_t) \rangle dt \quad (16)$$

- The condition

$$\mathcal{J} = \left\{ f \in L^2(\Xi, \mu) : \lim_{t \rightarrow \infty} \|P_t f - \langle f \rangle_\mu\|_{L^2(\mu)} = 0 \right\}$$

$$\varphi_i, \varphi_j \in \mathcal{D}(\mathcal{A}) \cap \mathcal{J}$$

is sharp.

For example, $\dot{x} = 1$, $z(t) = e^{ix(t)}$ can be regarded as a Markov process on \mathbb{S}^1 . Lebesgue measure on \mathbb{S}^1 is its stationary distribution. This example was given by Deuschel at this May for us.

Sketch of Proof:

- Due to direct computation

$$\langle G_{ij}\varphi(X_t) \rangle = -\langle \mathcal{A}\varphi_i, \varphi_j \rangle_\mu - \langle \mathcal{A}\varphi_j, \varphi_i \rangle_\mu. \quad (22)$$

$$\int_0^\infty \langle V\varphi_i(X_0)V\varphi_j(X_t) \rangle dt = \int_0^\infty \langle P_t\mathcal{A}\varphi_j, \mathcal{A}\varphi_i \rangle_\mu dt \quad (23)$$

$$= \lim_{t \rightarrow \infty} \langle P_t\varphi_j, \mathcal{A}\varphi_i \rangle_\mu - \langle \varphi_j, \mathcal{A}\varphi_i \rangle_\mu. \quad (24)$$

-

$$\lim_{t \rightarrow \infty} \|P_t f - \langle f \rangle_\mu\|_{L^2(\mu)} = 0 \quad \text{AND} \quad \langle \mathcal{A}\varphi \rangle_\mu = 0$$

\Rightarrow

$$\lim_{t \rightarrow \infty} \langle P_t f, \mathcal{A}\varphi \rangle_\mu = 0$$

4 Discussion

There are different understand for “Diffusion coefficient” and “Velocity” in statistical physics. So, different forms of Green-Kubo formulas are derived from different definitions.

Suppose that $(v_x(t), v_y(t))$ is the velocity. Let the instantaneous position be

$$x(t) = x(0) + \int_0^t v_x(s) ds \equiv x(0) + \delta x(t). \quad (29)$$

$y(t)$ is similar.

Definition: The asymptotic diffusion coefficient is defined by

$$\lim_{t \rightarrow \infty} \frac{d}{dt} \langle \delta x^2(t) \rangle.$$

• **Example 1** For the A-Langevin equations

$$\begin{bmatrix} dv_x(t) \\ dv_y(t) \end{bmatrix} = \begin{bmatrix} -r & \Omega \\ -\Omega & -r \end{bmatrix} \begin{bmatrix} v_x(t) \\ v_y(t) \end{bmatrix} dt + \sigma \begin{bmatrix} dB_1(t) \\ dB_2(t) \end{bmatrix}, \quad (30)$$

$r > 0, \Omega > 0$, Clearly, $(v_x(t), v_y(t))$ has an invariant distribution. It is shown by Balescu that

$$\lim_{t \rightarrow \infty} \frac{d}{dt} \langle \delta x^2(t) \rangle = 2 \int_0^\infty \langle v_x(t) v_x(0) \rangle dt. \quad (31)$$

This is also named Green-Kubo formula.

Balescu, R., *Statistical Dynamics Matter out of Equilibrium*. London: Imperial College Press, 1997.

However, the process associated with a complete set of variables

$$\{\xi_t = (x(t), y(t), v_x(t), v_y(t))\}$$

is a Markov process. The mean forward velocity of $x(t)$ is exactly $v_x(t)$.
But, the process $(\xi_t)_{t \geq 0}$ has no invariant distribution, which prevents our Green-Kubo formula from being used.

退出

- **Example 2** Suppose $p(t)$ is the momentum. For the harmonic oscillator, the explicit equations of motions are

$$\begin{cases} d x = \frac{p}{m} d t \\ d p = (-m\omega_0^2 x - \gamma p) d t + \sqrt{2kTm\gamma} d B(t), \end{cases} \quad (32)$$

$(\xi_t = (x(t), p(t)))_{t \geq 0}$ is a Markov diffusion with invariant distribution

$$\rho(x, p) = \frac{\omega_0}{2\pi kT} \exp\left\{-\frac{m\omega_0^2 x^2}{2kT} - \frac{p^2}{2mkT}\right\}$$

Risken Risken, H., *The Fokker-Plank Equation*. 2nd Edition, Springer-Verlag, 1989.

Zwanzig, R., *Nonequilibrium Statistical Mechanics*. Oxford University Press, 2001.

访问主页

标题页

◀ ▶

◀ ▶

第 32 页 共 34 页

退出

Then

$$V(x(t)) = \frac{p(t)}{m}$$

Thus, we have that

$$\langle Gx(t) \rangle = \lim_{t \rightarrow \infty} \frac{d}{dt} \langle \delta x^2(t) \rangle = 2 \int_0^\infty \left\langle \frac{p(t)}{m} \frac{p(0)}{m} \right\rangle dt. \quad (33)$$

The asymptotic diffusion coefficient and the expectation of the conditional diffusion coefficient are identical now. This means these two different diffusion coefficients lead to the same Green-Kubo formula for this example.
